

Functional Requirements Document (FRD): Development of a Mobile Application for Quran Learning and Teaching

1. Project Overview

Development of a Mobile Application for Quran Learning and Teaching (also referred to as "Quran Connect") is a specialized marketplace application designed to bridge the gap between Quran students and qualified teachers. The platform serves as a discovery, vetting, and payment hub. While the initial connection and financial transactions happen within the app, the educational delivery is outsourced to established communication tools like WhatsApp and Telegram to ensure immediate scalability and a low-latency learning environment.

2. User Personas

Persona	Goals & Needs
Student	Wants to find a compatible Quran teacher, view their teaching style via video, check student reviews, and pay securely.
Teacher	Wants to list courses, showcase expertise through an intro video, manage earnings in a digital wallet, and communicate with students.

3. Functional Requirements

3.1 Teacher Profiles & Course Listings

- **Course Management:** Teachers can create listings featuring the Course Name, detailed description, and the specific Fee/Price.
- **Introduction Video:** Integration of a high-performance video player.
 - *Technical Note:* Use **Mux** or **Cloudinary** for adaptive bitrate streaming to ensure zero lag for students globally.
- **WhatsApp Integration:** A "Contact on WhatsApp" CTA that triggers a pre-filled message to the teacher's registered number.

3.2 Student Feedback System

- **Star Ratings:** A 1-5 star rating system for students to rate their learning experience.
- **Written Reviews:** A text area for students to leave qualitative feedback.
- **Trust Metrics:** Profiles must display an average rating and total number of reviews to establish social proof.

3.3 In-App Wallet & Financials

- **Wallet Dashboard:** A real-time view of current balance, pending funds, and total earnings.
- **Security (KYC):** A mandatory **Know Your Customer** module. Teachers must upload government ID and verify their identity before the "Withdraw" function is unlocked.
- **Transactions:** Ability to "Deposit" funds for students and "Withdraw" to local bank accounts or mobile money for teachers.

4. User Journey Map

1. **Discovery:** Student browses the marketplace and filters by course type.
2. **Evaluation:** Student watches the teacher's Intro Video and reads previous student ratings/reviews.
3. **Inquiry:** Student clicks the WhatsApp button to discuss scheduling or specific needs.
4. **Payment:** Student pays the course fee through the app; funds are recorded in the system.
5. **Onboarding:** Teacher provides the link to the **Private Telegram Channel** where the full course material and live sessions reside.

5. Technical Recommendations

Feature	Recommended Integration
Video Hosting	Mux Video API (for fast, optimized playback)
Communication	WhatsApp Business API / Telegram Bot API
Payments	Stripe, PayPal, or local Mobile Money APIs
Identity Verification	Jumio or Onfido (for automated KYC)

6. Scalability Strategy

By utilizing the **Marketplace Model**, the application avoids the high overhead of building custom

video-conferencing software. Leveraging Telegram for course delivery allows the platform to support thousands of concurrent students with minimal server costs on the app side, focusing development efforts on the financial and discovery modules.
